

Wood is a living product and changes in temperature and humidity make it swell or shrink. All Pergo commercial wood floors are built up of 4 layers, where the core layer is laid crossways to the face layer and backing, providing additional strength and ensuring maximum stability.

4-LAYER BUILD-UP FOR PERFECT STABILITY

- **01.** Protective finish. 7 layers of lacquer or 2 layers of oil.
 - **02.** Face layer 3.2 mm thick and can be sanded 2-3 times.
 - **03.** Advanced wooden core absorbs the stresses put on the floor and ensures stability.
-
- **04.** Balanced backing helps balance the boards.

PROTECTIVE FINISHES

The two finishes offered by Pergo bring out different qualities in the wood and give it a distinct look.

7 protective layers of lacquer

Our floors are highly scratch and wear resistant compared to other lacquered wood floors. The lacquer also makes the floor **dirt-repellent, easy to clean and resistant against water as well as household chemicals**. The icons indicate the shine of the floor, either a satin or a mat floor. Satin finish gives a polished look to the floor. Mat finish creates the impression that the floor is made from untreated bare wood.
